# MATH 213 (Important Results)

## Separable ODE

• Goal: separate functions and derivatives of x and y to either side of the equation

$$f(x) = g(y)y'$$
  $\implies \int f(x)dx = \int g(y)dy$  then integrate both sides as normal

## **Exact ODE**

$$M(x,y)dx + N(x,y)dy = 0$$
  
=  $du$  where  $u$  is some function of  $x$  and  $y$ 

- Goal: find function u(x,y) = C (aka. an implicit solution of y)
- The equation is **exact** if & only if  $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$

$$u = \int M dx + k(y)$$
 then set  $N = \frac{\partial u}{\partial y}$  to solve for  $k(y)$ 

Alternatively,

$$u = \int N dy + k(x)$$
 then set  $M = \frac{\partial u}{\partial x}$  to solve for  $k(x)$ 

• If equation is **not exact**, find the **integrating factor**  $\mu$  such that:

$$\frac{\partial}{\partial y}\mu M = \frac{\partial}{\partial x}\mu N$$
 then solve as  $\mu M(x,y)dx + \mu N(x,y)dy = 0$ 

## First-Order Linear ODE (With Variable Coefficients)

• Homogeneous: y' + p(x)y = 0

$$y(x) = Ce^{-h}, \quad h = \int p(x)dx$$

• Nonhomogeneous: y' + p(x)y = q(x)

$$y(x) = e^{-h} \left( \int e^h q(x) dx + C \right), \quad h = \int p(x) dx$$

## Nth-Order Linear ODE (Homogeneous)

$$y^{(n)} + p_1(x)y^{(n-1)} + \ldots + p_{n-1}(x)y' + p_n y = r(x)$$
$$= L[y] \quad \text{(differential operator)}$$

• Goal: find a family of functions which are all solutions of the ODE (General solution)

$$y = c_1 y_1 + \ldots + c_n y_n$$
  
where  $y_1 \ldots y_n$  are linearly independent particular solutions (a specific function)

## Nth-Order Linear ODE (Homogeneous w/ Constant Coefficients)

• Characteristic equation of L[y] = 0 is:

$$\lambda^n + a_{n-1}\lambda^{n-1} + \ldots + a_1\lambda + a_0 = 0$$
 with roots  $\lambda_1 \ldots \lambda_n$ 

• General solution:

$$y = c_1 e^{\lambda_1 x} + \ldots + c_n e^{\lambda_n x}$$
  
where every  $y = e^{\lambda x}$  is linearly independent if every  $\lambda$  is distinct

• Repeated roots: for a root  $\lambda$  of order k,

$$e^{\lambda x}, xe^{\lambda x}, x^2e^{\lambda x}\dots x^{k-1}e^{\lambda x}$$
 are linearly independent solutions

• Complex roots: for two complex roots  $\lambda_1 = ik, \lambda_2 = -ik,$ 

$$y = c_1 e^{ikx} + c_1 e^{-ikx} = A\cos(kx) + B\sin(kx)$$

## Nth-Order Linear ODE (Nonhomogeneous)

$$L[y] = f_1(x) + \ldots + f_k(x)$$

• General solution:

$$y = y_h + y_{p1} + \ldots + y_{pk}$$

where  $y_h$  is a general solution of L[y] = 0and  $y_{pi}$  is a particular solution of  $L[y] = f_i(x)$ 

• Method of undetermined coefficients:

- $f_i(x)$   $\rightarrow y_p i(x) = \text{sum of linear independent derivatives}$
- $f_i(x) = k \text{ (constant term)} \rightarrow C$

$$\bullet \quad f_i(x) = e^{kx} \qquad \qquad \to \quad y_{pi}(x) = Ce^{kx}$$

$$f_i(x) = x^n, n \ge 0$$
  $\rightarrow y_{pi}(x) = C_n x^n + \ldots + C_1 x + C_0$ 

• 
$$f_i(x) = \cos(kx), \sin(kx)$$
  $\rightarrow y_{pi}(x) = A\cos(kx) + B\sin(kx)$ 

• 
$$f_i(x) = e^{rx}\cos(kx), e^{rx}\sin(kx)$$
  $\rightarrow$   $y_{pi}(x) = e^{rx}A\cos(kx) + B\sin(kx)$ 

■ Substitute  $y_p$  into LHS and match coefficients with RHS:

$$L[y_p] = f(x)$$
 and solve for constants

## Laplace Transform

$$F(s) = L\{f\}(t) = \int_0^\infty f(t)e^{-st}dt$$

• Transforms of derivatives:

$$L\{f'\} = sF - f(0)$$
  
$$L\{f^{(n)}\} = s^n F - s^{n-1} f(0) - \dots - s f^{(n-2)}(0) - f^{(n-1)}(0)$$

• Transforms of integrals:

$$L\{\int_0^t f(r)dr\} = \frac{F}{s}$$

• Derivatives of transforms (multiplication):

$$L\{tf(t)\} = -F'(s)$$

• Integrals of transforms (division):

$$L\{\frac{f(t)}{t}\} = \int_{s}^{\infty} F(r)dr$$

• S-shifting:

$$L\{e^{at}f(t)\} = F(s-a)$$

• T-shifting:

$$L\{f(t-a)H(t-a)\} = e^{-as}F(s)$$

where 
$$H(t) = 0$$
 if  $t < 0$   
= 1 if  $t > 0$ 

• Dirac's delta function:

$$L\{\delta(t-a)f(t)\} = e^{-as}f(a)$$

where 
$$\delta(t) = \infty$$
 if  $t = 0$   
= 0 elsewhere

and 
$$\int_0^\infty \delta(t)dt = 1$$

• **Periodic functions**: if f(t+T) = f(t) for all t in domain,

$$L\{f(t)\} = \frac{1}{1 - e^{-sT}} \int_0^T f(t)e^{-st}dt$$

• Convolution:

$$F(s)G(s) = L\{f(t) * g(t)\} = L\{\int_0^t f(r)g(t-r)dr\}$$

• Initial value theorem: if f is continuous, f' is piecewise continuous, and f, f' are of exponential order,

$$\lim_{s \to \infty} sF(s) = f(0)$$

- Using Laplace in ODEs:
  - Given with initial conditions y(0), y'(0):

$$y'' + ay' + by = f(t)$$

$$L\{y'' + ay' + by\} = F(s)$$

$$(s^{2}Y - sy(0) - y'(0)) + a(sY - y(0)) + bY = F(s)$$

- $\blacksquare$  Collect like terms, solve for Y
- Solve for  $y(t) = L^{-1}{Y}$

## **Vector Spaces**

#### Fourier Series

• For f(x) with period 2L, defined over -L < x < L

$$f(x) = a_0 + \sum_{n=1}^{\infty} \left( a_n \cos\left(\frac{n\pi x}{L}\right) + b_n \sin\left(\frac{n\pi x}{L}\right) \right)$$

$$a_0 = \frac{1}{2L} \int_{-L}^{L} f(x) dx$$

$$a_n = \frac{1}{L} \int_{-L}^{L} f(x) \cos\left(\frac{n\pi x}{L}\right) dx$$

$$b_n = \frac{1}{L} \int_{-L}^{L} f(x) \sin\left(\frac{n\pi x}{L}\right) dx$$

• If f(x) is even, the series only has  $a_0$  and  $a_n$  terms (Fourier cosine series) where

$$f(x) = a_0 + \sum_{n=1}^{\infty} a_n \cos\left(\frac{n\pi x}{L}\right)$$
$$a_0 = \frac{1}{L} \int_0^L f(x) dx$$
$$a_n = \frac{2}{L} \int_0^L f(x) \cos\left(\frac{n\pi x}{L}\right) dx$$

• If f(x) is odd, the series only has  $b_n$  terms (Fourier sine series) where

$$f(x) = \sum_{n=1}^{\infty} b_n \sin\left(\frac{n\pi x}{L}\right)$$
$$b_n = \frac{2}{L} \int_0^L f(x) \sin\left(\frac{n\pi x}{L}\right) dx$$

• Complex exponential form:

$$f(x) = \sum_{n = -\infty}^{\infty} c_n e^{in\pi x/L}$$
$$c_n = \frac{1}{2L} \int_{-L}^{L} f(x) e^{-in\pi x/L} dx$$

■ Where

$$\sum_{n=-\infty}^{\infty} a_n \equiv \lim_{N \to \infty} \sum_{-N}^{N} a_n$$

## • Half/quarter-range expansions:

- Half-range cosine expansion
  - Given f(x) on 0 < x < L, extend as an even periodic function on  $-\infty < x < \infty$
  - Identical to Fourier cosine series (with restriction on 0 < x < L)
- Half-range sine expansion
  - Given f(x) on 0 < x < L, extend as an odd periodic function on  $-\infty < x < \infty$
  - Identical to Fourier sine series (with restriction on 0 < x < L)
- Quarter-range cosine expansion

$$f(x) = \sum_{n=1,3,\dots}^{\infty} a_n \cos\left(\frac{n\pi x}{2L}\right) \qquad (0 < x < L)$$
$$a_n = \frac{2}{L} \int_0^L f(x) \cos\left(\frac{n\pi x}{2L}\right)$$

■ Quarter-range sine expansion

$$f(x) = \sum_{n=1,3,\dots}^{\infty} b_n \sin\left(\frac{n\pi x}{2L}\right) \qquad (0 < x < L)$$
$$b_n = \frac{2}{L} \int_0^L f(x) \sin\left(\frac{n\pi x}{2L}\right)$$

• Useful integrals:

$$\int x \cos(nx) dx = \frac{x \sin(nx)}{n} + \frac{\cos(nx)}{n^2}$$

$$\int x \sin(nx) dx = -\frac{x \cos(nx)}{n} + \frac{\sin(nx)}{n^2}$$

$$\int_0^{2\pi} \sin(ax) dx = \int_0^{2\pi} \cos(ax) dx = \int_0^{2\pi} \sin(ax) \cos(bx) dx = 0 \quad \text{for any } a, b$$

• Useful identities:

$$\sin(x)\cos(y) = \frac{1}{2}(\sin(x+y) + \sin(x-y))$$

$$\cos(ax) = \frac{1}{2}(e^{iax} + e^{-iax})$$

$$\sin(ax) = \frac{1}{2i}(e^{iax} - e^{-iax})$$

$$\cos(n\pi) = (-1)^n$$

## Fourier Transform

• Fourier integral:

$$f(x) = \int_0^\infty (A(\omega)\cos\omega x + B(\omega)\sin\omega x)d\omega$$
$$A(\omega) = \frac{1}{\pi} \int_{-\infty}^\infty f(x)\cos\omega x dx$$
$$B(\omega) = \frac{1}{\pi} \int_{-\infty}^\infty f(x)\sin\omega x dx$$

• Fourier transform:

$$F\{f(x)\} = \hat{f}(\omega) = \int_{-\infty}^{\infty} f(x)e^{-i\omega x}dx$$
$$F^{-1}\{\hat{f}(\omega)\} = f(x) = \frac{1}{2\pi} \int_{-\infty}^{\infty} \hat{f}(\omega)e^{i\omega x}d\omega$$

■ Transforms of derivatives:

$$F\{f'\} = i\omega \hat{f}$$
$$F\{f^{(n)}\} = (i\omega)^n \hat{f}$$

■ Transforms of integrals:

$$F\{\int_{-\infty}^{x} f(r)dr\} = \frac{1}{i\omega}\hat{f}$$

■ **Derivatives of transforms** (multiplication):

$$F\{x^n f\} = i^n \hat{f}^{(n)}$$

■ x-shifting:

$$F\{f(x-a)\} = e^{-ia\omega}\hat{f}$$

• w-shifting:

$$F\{e^{iax}f\} = \hat{f}(\omega - a)$$

■ Horizontal scaling:

$$F\{f(ax)\} = \frac{1}{|a|}\hat{f}\left(\frac{\omega}{a}\right)$$

**■** Fourier convolution:

$$\hat{f} \cdot \hat{g} = F\{f * g\} = F\{\int_{-\infty}^{\infty} f(x - r)g(r)dr\}$$

# • Fourier cosine & sine transforms:

$$F_C\{f'\} = \omega \hat{f}_S - f(0)$$

$$F_S\{f'\} = -\omega \hat{f}_C$$

$$F_C\{f''\} = -\omega^2 \hat{f}_C - f'(0)$$

$$F_S\{f''\} = -\omega^2 \hat{f}_S + \omega f(0)$$
